

CAPEX detail: % deviation vs. insulation surcharge (EUS)

0% surcharge = SC-U / LP-U (no insulation, but still part of the sweep -- unlike the pre-insulation-feature SC-BM/LP-BM benchmark runs, which define the 0% deviation line in the four left/center panels and aren't otherwise part of this trend). Liquid sweep stops at +60%. † both benchmark runs predate the insulation feature (insulation CAPEX = 0 there), so this row's deviation from benchmark is undefined -- its absolute value is shown instead.
